Server and Unit Test Report
(server)

Sprint 1

User Story
As a back-end developer, I need a database to store user information and card data

Task
Configure SQL server/Configure django server to process these requests

Scenario
- Database built using django and python
- All card information is inserted into the database
- Player registers on iphone app/website
- Player account is registered and inputted in the database
- The basic cat cards, abilities, and chance cards are associated with the player in the database
